2'-fucosyllactose-APD-BSA

(H terminal)

Fuc α 1-2Gal β 1-4(Glc)-APD-BSA

The oligosaccharide is linked to BSA lysine residues via a spacer using the isothiocyanate coupling method. The spacer used is acetyl-phenylenediamine (APD). It is attached to the oligosaccharide by reductive amination. The reducing monosaccharide unit is thus transformed to an aminoalditol. The monosaccharide unit modified in this way is given in parenthesis.

The conjugates normally contain 10-20 moles oligosaccharide per mole BSA.

The conjugate is supplied as a freeze dried powder.

Storage: -18° C.
